My Project

Civil Status and Passports Department Application(Participated in the Crown Prince Award for Best Government Services Application)

The Civil Services and Passports application offers a distinctive set of functions and features to meet the needs of citizens easily and effectively. The application allows users to: 1. Choose the required service: Users can specify the type of service they wish to benefit from, whether through the services guide, using service application forms, or accessing electronic services. 2 Service application forms: If the user chooses to use the service application forms, a list of all the forms available to the department will be displayed to them clearly. Users can download these forms in paper format to print them and fill in the required information. 3 Detailed inquiry about the forms: The application allows users to inquire in detail about each box in the form, which helps them fill out the forms accurately. 4 Electronic services: For those who prefer to use electronic services, they can access a variety of services, such as passports and family books. 5. Service details: When the user selects a specific service, such as a passport, multiple options will be displayed such as issuance for the first time, renewal, replacement for damaged, or replacement for lost. When selecting one of these options, an electronic form will be displayed containing the required data to be filled out and sent to the Civil Status Department. 6. Application tracking: After submitting the form, users can follow the status of their application and wait for approval or review. Upon approval, citizens can go to the department to receive the passport easily and conveniently. In short, the Civil Services and Passports application is an excellent tool that provides multiple means to provide government services in a simplified and convenient manner for citizens.

University Bus
The idea of the project revolves around organizing the work of buses and the ease of dealing with them by the student. The services provided in our project are carried out through mobile applications and are aimed at all students, bus drivers and movement management. The application offers the possibility of riding the student on the bus and going to the university easily. The app enables students and drivers to share their locations so that students can see where the bus Is located and tell it that is on this location. The system allows movement management to monitor the movement of buses, their locations, the number of students inside the bus and the number of seats available. All of these services provided on the platform revolve around one main goal, which is to provide the student with a high-level transportation service to the university with the fewest number of steps.
